Niresh Snow Leopard 10.6.7 Iso is not an official product of Apple, and it is not supported or endorsed by them. It is also not legal to use Mac OS X on non-Apple hardware, according to Apple's terms and conditions.

Therefore, if you decide to use Niresh Snow Leopard 10.6.7 Iso, you do so at your own risk and responsibility. You should also be aware of the potential issues and challenges that may arise from using a hackintosh system, such as compatibility problems, stability issues, software updates, etc.

If you want to download Niresh Snow Leopard 10.6.7 Iso, you can find it on various websites and torrent sites on the internet. However, you should be careful about the source and quality of the file, as some of them may contain viruses or malware that can harm your computer.

A safer and more reliable option is to download Mac OS X Snow Leopard 10.6 Iso from archive.org, which is a reputable website that hosts digital copies of various media and software products. You can then use Niresh's tools and guides to create a bootable DVD or USB drive with Niresh Snow Leopard 10.6.7 Iso.

Niresh Snow Leopard 10.6.7 Iso is a great way to experience Mac OS X on your PC, especially if you have an older or low-end system that cannot run newer versions of Mac OS X or Windows. However, you should also be aware of the risks and limitations involved in using a hackintosh system, and respect Apple's intellectual property rights.

If you have downloaded Niresh Snow Leopard 10.6.7 Iso and want to install it on your PC, you will need to follow some steps to make it work. Here is a brief overview of the installation process:

1. Burn Niresh Snow Leopard 10.6.7 Iso to a DVD or create a bootable USB drive with it. You can use any software that can burn ISO files, such as ImgBurn or Nero for Windows, or Disk Utility for Mac OS X.
2. Insert the DVD or USB drive into your PC and boot from it. You may need to change the boot order in your BIOS settings to do this.
3. When you see the Niresh boot menu, press F8 to enter some boot flags. Boot flags are commands that tell the system how to run Mac OS X on your PC. Depending on your hardware configuration, you may need different boot flags. Some common ones are -v for verbose mode, -x for safe mode, -f for ignoring caches, cpus=1 for single-core processors, arch=i386 for 32-bit mode, etc. You can find more boot flags and their explanations on various hackintosh websites and forums.
4. After entering the boot flags, press Enter to start the installation. You will see a welcome screen with various language options. Choose your preferred language and continue.
5. On the next screen, you will see a menu bar at the top. Click on Utilities and then Disk Utility. This is where you will format and partition your hard drive for Mac OS X.
6. Select your hard drive from the left sidebar and click on Partition. Choose 1 Partition from the drop-down menu and name it as Macintosh HD (or anything else you like). Make sure the format is Mac OS Extended (Journaled) and click on Options. Choose GUID Partition Table as the partition scheme and click OK.
7. Click on Apply to format and partition your hard drive. This will erase all the data on your hard drive, so make sure you have backed up anything important before doing this.
8. Close Disk Utility and return to the installer. Click on Continue and agree to the license agreement.
9. On the next screen, click on Customize. This is where you will select which components and drivers to install with Mac OS X. Niresh has already pre-selected some of them for you, but you can change them according to your needs and preferences.
10. You can expand each category by clicking on the arrow next to it. You will see various options with checkboxes next to them. Check or uncheck them as you wish. Some of the important categories are:
 - Bootloader: This is what allows you to boot Mac OS X on your PC. Niresh recommends using Chameleon as the bootloader, but you can also choose Clover if you want.
 - Boot Options: These are some extra settings for your bootloader, such as graphics mode, timeout, theme, etc.
 - Kernels: These are modified versions of Mac OS X's core system that allow it to run on different processors. Niresh has included several kernels for Intel and AMD processors, as well as Atom and legacy kernels for older systems.
 - Graphics: These are drivers for your graphics card that enable hardware acceleration and full resolution support. Niresh has included drivers for Nvidia, ATI, and Intel graphics cards.
 - Audio: These are drivers for your sound card that enable sound output and input. Niresh has included drivers for various sound cards from Realtek, VIA, etc.
 - Network: These are drivers for your network adapter that enable internet access and local network connectivity. Niresh has included drivers for various network adapters from Broadcom, Atheros, Realtek, etc.
 - Laptop Support: These are some extra components that enable better functionality and performance on laptops, such as battery management, trackpad support, brightness control, etc.
 - Patched Kexts: These are modified versions of Mac OS X's system files that enable compatibility with certain hardware components or fix some common issues.
11. After selecting the components and drivers you want to install, click OK and then Install. The installation will begin and may take some time depending on your system speed.
12. When the installation is finished, click Restart
